

Github Project: Git Commands

Documentation Template

Introduction to Version Control

You will use this template to copy and paste the git commands you used to complete all tasks on your local and remote git repository for this project. This file will serve as your submission for the GitHub project.

1. Set Up Your Repository

The following are the steps you will take to create your git repository, add your python code, and post your files on GitHub.

Step 1. Create a GitHub profile (if you don't already have one).

Step 2. Fork a repository from https://github.com/Maybetuandat/lab_github and provide a link to your forked GitHub repository here:

GitHub Repository Link
https://github.com/Phamthang-25/lab_github.git

Step 3. Complete the tasks outlined in the table below and copy and paste your git commands into the "Git Commands" column. The first git command is partially filled out for you.

	Tasks	Git Commands
A.	Clone the GitHub repository to your local repository.	git clone https://github.com/Phamthang-25/lab_github.git
B.	Move your bikeshare.py and data files into your local repository.	
C.	Create a .gitignore file containing the name of your data file.	echo "chicago.csv" >> .gitignore echo "new_york_city.csv" >> .gitignore echo "washington.csv" >> .gitignore

D.	List the file names associated with the data files you added to your .gitignore	cat .gitignore
E.	Check the status of your files to make sure your files are not being tracked	git status
F.	Stage your changes.	git add .
G.	Commit your changes with a descriptive message.	git commit -m "Add .gitignore"
H.	Push your commit to your remote repository.	git push origin main

2. Improve Documentation

Now you will be working in your local repository, on the BikeShare python file and the README.md file. You should repeat steps **C** through **E** three times to make at least three commits as you work on your documentation improvements.

	Tasks	Git Commands
A.	Create a branch named <i>documentation</i> on your local repository.	git branch documentation
B.	Switch to the <i>documentation</i> branch.	git checkout documentation
C.	Update your README.md file.	Em chỉnh trên giao diện VSCode luôn ah!
D.	Stage your changes.	git add .
E.	Commit your work with a descriptive message.	git commit -m "update README"
F.	Push your commit to your remote repository branch.	git push origin documentation
G.	Switch back to the master branch.	git checkout main

3. Additional Changes to Documentation

In a real world situation, you or other members of your team would likely be making other changes to documentation on the documentation branch. To simulate this follow the tasks below.

	Tasks	Git Commands
A.	Switch to the <i>documentation</i> branch.	git checkout documentation
B.	Make at least 2 additional changes to the documentation - this might be additional changes to the README or changes to the document strings and line comments of the bikeshare file.	Em chỉnh trên giao diện VSCode luôn ah!
C.	After each change, stage and commit your changes. When you commit your work, you should use a descriptive message of the changes made. Your changes should be small and aligned with your commit message.	git add . git commit -m "Update docs more"
D.	Push your changes to the remote repository branch.	git push origin documentation
E.	Switch back to the <i>master</i> branch.	git checkout main
F.	Check the local repository log to see how <i>all the branches</i> have changed.	git log --oneline --graph --all
G.	Go to Github. Notice that you now have two branches available for your project, and when you change branches the README changes.

4. Refactor Code

Now you will be working in your local repository, on the code in your BikeShare python file to make improvements to its efficiency and readability. You should repeat steps **C** through **E** three times to make at least three commits as you refactor.

	Tasks	Git Commands
A.	Create a branch named <i>refactoring</i> on your local repository.	git branch refactoring
B.	Switch to the <i>refactoring</i> branch.	git checkout refactoring
C.	Similar to the process you used in making the documentation changes, make 2 or more changes in refactoring your code.	
D.	<i>For each change</i> , stage and commit your work with a descriptive message of the changes made.	git add bikeshare.py git commit -m "Refactor bikeshare.py"
E.	Push your commits to your remote repository branch.	git push origin refactoring
F.	Switch back to the <i>master</i> branch.	git checkout main
G.	Check the local repository log to see how <i>all the branches</i> have changed.	git log --oneline --graph --all
H.	Go to GitHub. Notice that you now have 3 branches. Notice how the files change as you move through the branches.	...

5. Merge Branches

	Tasks	Git Commands
A.	Switch to the <i>master</i> branch.	git checkout main
B.	Pull the changes you and your coworkers might	git pull

	have made in the passing days (in this case, you won't have any updates, but pulling changes is often the first thing you do each day).	
C.	Since your changes are all ready to go, merge all the branches into the master. Address any merge conflicts. If you split up your work among your branches correctly, you should have no merge conflicts.	git merge documentation git merge refactoring
D.	You should see a message that shows the changes to the files, insertions, and deletions.	Hiện trong terminal
E.	Push the repository to your remote repository.	git push origin main
F.	Go to GitHub. Notice that your master branch has all of the changes.	...

6. Changing older commit messages

	Tasks	Git Commands
A.	Switch to the <i>master</i> branch.	<code>git checkout main</code>
B.	Check the local repository log to see how <i>all the branches</i> have changed.	<code>Git log --oneline --graph --all</code>
C.	Display a list of the commits that need edit messages.	<code>git log --oneline --reverse</code>
D.	Adding types to the titles commit into older commit messages	Ví dụ sửa 3 commit gần nhất <code>git rebase -i HEAD~3</code>
E.	Push the repository to your remote repository.	<code>git push origin main --force</code>
F.	Go to GitHub. Notice that your master branch has all of the changes.	

Submission:

This concludes the project.

- Please review this document to make sure you entered all the required response fields in all four sections.
- Download this document as a PDF file.
- Push this pdf file into your fork repository
